

ABSTRACT

A compound power supply switch for notebook computers includes a coupling module and a power supply control module to enable users to unfasten the coupling module between the display panel and the processor, and at the same time activate the power supply control module and enable the processor to enter machine start process, thereby simplifying opening and machine start operations of notebook computers, and also shortening machine start operation time. In addition, extra space may be saved to accommodate other functional devices and meet market demands of multiple functions, slim size, and light weight for notebook computers.
